

Batiqitos Lagoon Valley Groundwater Basin

- Groundwater Basin Number: 9-22
- County: San Diego
- Surface Area: 741 acres (1.2 square miles)

Basin Boundaries and Hydrology

This groundwater basin underlies Green Valley and San Marcos Creek Valley in western San Diego County (Rogers 1965; DWR 1967). The basin is bounded on the northeast by impermeable crystalline rocks, on the west by Batiqitos Lagoon, and otherwise by semi-permeable rocks of the La Jolla Formation. San Marcos and Encinitas Creeks drain the valleys westward into Batiqitos Lagoon. Average annual precipitation ranges from 7 to 15 inches.

Hydrogeologic Information

Water Bearing Formations

The primary water-bearing unit in this basin is Quaternary alluvium, which consists of gravel, sand, silt, and clay deposits that reach a maximum thickness of about 100 feet (DWR 1967). Additional groundwater is produced from the Eocene La Jolla Formation (DWR 1967).

Groundwater Level Trends

The water level in a well in the western part of the basin was at about 56 feet depth in 1977.

Groundwater Storage

Groundwater Storage Capacity. Unknown

Groundwater in Storage. Unknown

Groundwater Budget (Type C)

Not enough information is available to construct a budget.

Groundwater Quality

Characterization. Groundwater in this basin is dominantly sodium chloride in character and has an average TDS content of about 1,280 mg/L with a range from about 788 to 2,362 mg/L (DWR 1967).

Impairments. The groundwater in this basin was rated inferior for irrigation because of high chloride content and marginal for domestic use because of high sulfate and TDS concentrations (DWR 1967).
